

ABSTRACT

An apparatus and method for removing coating material from tubing is disclosed that includes a tool body, a tubing support, a slider support, a slider accommodated with the slider support, and a blade attached to the slider, wherein the tubing support, and the slider support are accommodated with the tool body. The apparatus can be utilized to remove protective coating materials from steel tubing, by placing the tubing on the tubing support, lowering the blade to the tubing, and rotating the apparatus around the tubing.
